

No-CoT depth grows with size; looped models sit at or below standard ones of their size

Chain

Arithmetic

Descriptive only: the models differ in training data. Looped models at their trained recurrence (Ouro 4 passes, Huginn 32 steps, Nanbeige 2 loops).
 d_{soft} : the depth fit on $\log P(\text{gold})$ with no CoT; 0 = at chance on every depth. Bars: 95% paired bootstrap.
