

Arithmetic: where the recurrence gain sits (a gain that grows with h would be serial depth)

mean log P(gold): more minus fewer passes

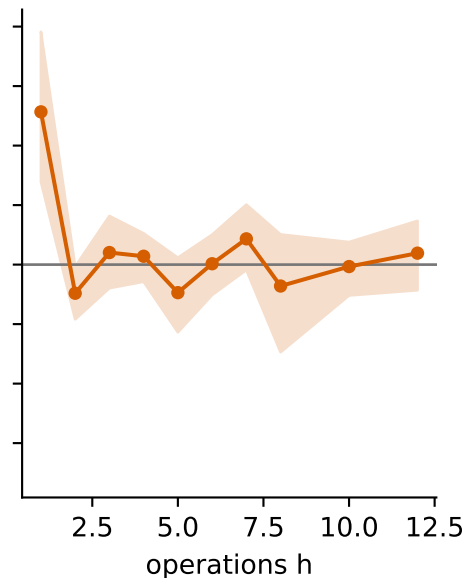

Ouro-2.6B: 4 vs 2 passes

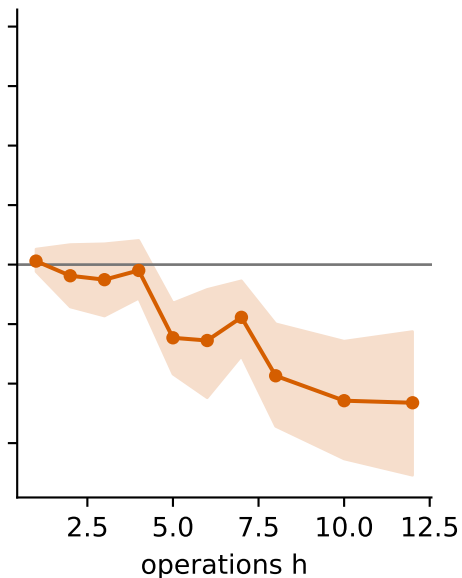

Ouro-1.4B: 4 vs 2 passes

Huginn: 32 vs 8 steps

IQuest 40B: looped vs non-looped twin

Per depth, the mean over 40 items of log P(gold) under more minus fewer passes; band: 95% paired bootstrap. Beyond about 3 operations both arms are near chance, so differences there reflect how each spreads its answer probability (calibration), not computation.
